

PayVia API Documentation QA Report

Executive Summary

QA testing conducted on PayVia Mintlify documentation (<https://payvia-65a748ab.mintlify.app/>) Date: March 30, 2026

Critical Issues Found

1. API Endpoint Inconsistencies

Issue: Multiple payment endpoint patterns across documentation

- Backend Integration shows: `POST {{baseUrl}}/v4/payments/` (with trailing slash)
- Testing Guide shows: `POST {{baseUrl}}/v4/payments` (without trailing slash)
- API Reference shows: `POST /v4/payments`

Impact: High - Developers may encounter 404 errors **Recommendation:** Standardize to `/v4/payments` (no trailing slash) throughout

2. Authentication Flow Gaps

Issue: Token expiration and refresh not documented

- No mention of token TTL (time to live)
- No refresh token mechanism explained
- Error handling example suggests refreshing token but doesn't show how

Impact: Medium - Production apps may fail unexpectedly **Recommendation:** Add section on token lifecycle management

3. Payment Method Data Structure Confusion

Issue: Documentation shows conflicting requirements

- Says "You must provide either paymentMethodId OR paymentMethodData"
- But all examples only show paymentMethodData
- No working example of paymentMethodId usage

Impact: High - Developers can't implement stored payment methods

Recommendation: Add complete example of paymentMethodId flow

4. Split Payment Configuration Issues

Issue: Amount units inconsistent

- Main payment uses dollars: `"amount": 1.00`
- Split config uses cents: `"amount": 750` (in cents comment)
- No clear conversion or validation rules

Impact: Critical - Could cause incorrect payment amounts **Recommendation:**

Standardize on one unit (suggest dollars) with clear documentation

5. Webhook Configuration Incomplete

Issue: Setup process not documented

- Shows webhook payload format
- Shows configuration options
- But doesn't show HOW to register webhooks (API endpoint missing)

Impact: Medium - Developers can't enable webhooks **Recommendation:** Add

POST /v4/webhooks endpoint documentation

Medium Priority Issues

6. Error Response Format Inconsistency

Issue: Two different error formats shown

- JSON:API format with `errors` array (Error Handling Guide)
- Simple format with single `error` object (Testing Guide)

Impact: Medium - Error parsing may fail **Recommendation:** Use JSON:API format consistently

7. Test Credentials Security

Issue: Sandbox credentials exposed in public docs

```
Merchant ID: digitzs-test-718643500-3230807-1732171363
App Key: HTxKp4jh1cSIprscR81zXt6Ets0up1wNf8HPNLR5vTNWMAUloj0i7yEh
API Key: p0ZnjKUSBk8pEhBo0Au0qzz6WpfqLxm3YmmZnDy2
```

Impact: Low - Sandbox only, but still bad practice **Recommendation:** Replace with placeholder variables, provide in developer portal

8. Kount Integration Not Explained

Issue: References to Kount appear but no integration guide

- Frontend passes `kountResponse` to backend
- No documentation on how to get/generate this
- No explanation of Kount session setup

Impact: High - Fraud prevention won't work correctly **Recommendation:** Add Kount integration guide

9. Missing Refund Documentation

Issue: API Reference mentions refund endpoint but no details

- Listed as: `POST /v4/payments/{paymentId}/refund`
- No request/response examples
- No partial refund documentation

Impact: Medium - Refund functionality unclear **Recommendation:** Add complete refund API documentation

10. ACH Payment Method Undocumented

Issue: UI mentions ACH tab but no ACH payment examples

- Frontend shows `achTabLabel` styling option
- No ACH token format documented
- No ACH-specific requirements shown

Impact: Medium - Can't implement ACH payments **Recommendation:** Add ACH payment method documentation

Low Priority Issues

11. Rate Limiting Values Unclear

Issue: Rate limits mentioned but not specified

- Says "Rate limit of 100 requests per minute exceeded"
- No documentation of actual limits per endpoint
- No guidance on optimal request patterns

Impact: Low - Developers may hit limits unknowingly **Recommendation:** Document rate limits per endpoint

12. CORS Configuration Not Covered

Issue: Frontend makes cross-origin requests but CORS not addressed

- No mention of allowed origins
- No troubleshooting for CORS errors
- Iframe postMessage security could be clearer

Impact: Low - May cause confusion during development **Recommendation:** Add CORS configuration section

13. Order Items Schema Validation Unclear

Issue: Order items have mixed required/optional fields

- Documentation shows (required) and (optional) inconsistently
- Type field marked optional but seems required for fraud detection
- No validation error examples

Impact: Low - Minor confusion **Recommendation:** Clarify required vs optional fields

14. Production Migration Checklist Incomplete

Issue: Checklist exists but lacks detail

- Generic items like "Code Updates" with no specifics
- No environment variable checklist
- No rollback procedure

Impact: Low - Could cause production issues **Recommendation:** Expand with specific verification steps

Positive Findings

What Works Well:

1. Clean, modern documentation design
2. Good use of code examples
3. Error handling guide is comprehensive
4. Frontend integration guide is detailed
5. Testing section includes multiple scenarios
6. Proper use of JSON:API standard (mostly)

Recommended Fixes Priority

Immediate (Critical):

1. Fix split payment amount units inconsistency
2. Add paymentMethodId complete example
3. Standardize API endpoint URLs

Short-term (High Priority):

4. Add Kount integration documentation
5. Document token lifecycle/refresh
6. Add webhook registration endpoint
7. Add ACH payment documentation

Medium-term:

8. Standardize error response formats

9. Add refund API documentation
10. Replace public test credentials
11. Document rate limits

Long-term (Nice to Have):

12. Add CORS configuration guide
13. Expand production checklist
14. Add troubleshooting section
15. Add video tutorials

Testing Recommendations

API Endpoints to Test:

- ☐ POST /v4/auth/token
- ☐ POST /v4/payments (card payment)
- ☐ POST /v4/payments (stored payment method)
- ☐ POST /v4/payments (split payment)
- ☐ GET /v4/payments/details/{merchantId}/{paymentId}
- ☐ POST /v4/payments/{paymentId}/refund
- ☐ POST /v4/webhooks (if exists)

Integration Tests Needed:

- ☐ Frontend iframe integration
- ☐ Token expiration handling
- ☐ Rate limiting behavior
- ☐ Error response parsing

- ☐ Webhook delivery
- ☐ Split payment calculations
- ☐ Kount session integration

Conclusion

The PayVia API documentation is well-structured with good examples, but has several critical inconsistencies that could cause integration failures. The most urgent fixes are around split payments, stored payment methods, and API endpoint standardization.

Overall Grade: B-

- Documentation Quality: A
- Completeness: C+
- Accuracy: B
- Examples: A-
- Organization: A

Action Items

1. Review and fix critical issues within 1 week
2. Add missing documentation within 2 weeks
3. Implement comprehensive test suite
4. Add interactive API playground
5. Schedule quarterly documentation reviews
