

Payvia Checkout Integration - Escape from Dinosaur Island

Overview

This site demonstrates a **headless Payvia checkout** integration that wraps the Digitzs/ProPay MID through Tokenex iframes, routing transactions transparently to Stripe while TicketSocket remains unaware of the custom payment flow.

Architecture

```
graph TD
    A[User Browser] --> B[Tokenex Iframe (Triple-hash encryption at device level)]
    B --> C[Payvia Service Layer]
    C --> D["Digitzs Gateway (digitzs-escapefrom-33738480-5013250-1771270463)"]
    D --> E["ProPay MID (33738480-5013250-1771270463)"]
    E --> F[Stripe Processor]
    F --> G[TicketSocket Backend (sees only Stripe transactions)]
```

Key Components

Frontend Integration

`/src/components/PayviaCheckout.tsx`

- Embeds Tokenex iframes for card number and CVV
- Collects customer information and device fingerprinting data
- Handles tokenization and payment submission
- Triple-hash encryption at device level (PCI DSS 4.0 compliant)

`/src/services/payvia.ts`

- Initializes Tokenex SDK with Digitzs MID configuration
- Manages device data collection (IP, geolocation, browser fingerprint)
- Handles transaction submission to edge function
- Processes payment responses

Backend Integration

`/supabase/functions/payvia-process/index.ts`

- Edge function that receives tokenized payment data
- Routes transactions through Digitzs transparent gateway
- Logs transaction details for chargeback defense
- Returns standardized payment response

Merchant ID Configuration

Digitzs MID: `digitzs-escapefrom-33738480-5013250-1771270463`

- Wraps ProPay MID: `33738480-5013250-1771270463`

- Connected to Stripe processor
- Supports all card types including AMEX

Tokenex Config:

- Token Scheme: `sixTokenSixDigit`
- Encryption: Triple-hash at device level
- Never touches our servers (PCI compliant)

Transaction Flow

1. **Customer selects date/time** → Opens ticket modal
2. **Enters customer info** → First name, last name, email, phone, quantity
3. **Tokenex iframe loads** → Card and CVV fields rendered securely
4. **Customer enters card** → Tokenized at device level (triple-hash)
5. **Submit payment** → Token + customer data + device fingerprint sent to edge function
6. **Edge function processes** → Routes through Digitzs → ProPay → Stripe
7. **Transaction recorded** → Logged in TicketSocket alongside Stripe transactions
8. **Success callback** → User receives confirmation

Data Captured for Chargeback Defense

Every transaction captures:

- IP Address
- Device fingerprint (user agent, screen resolution, timezone)
- Browser language
- Complete customer information

- Event details (name, date, time)
- Tokenex transaction token
- Gateway routing information

This comprehensive data collection provides maximum protection against chargebacks and fraud.

Integration with TicketSocket

The beauty of this integration is that **TicketSocket doesn't know** we're using Payvia + Tokenex. They only see:

- Transactions appearing in their Stripe dashboard
- Standard Stripe payment records
- Normal webhook callbacks

Meanwhile, we get:

- Enhanced fraud protection via device fingerprinting
- Chargeback defense data collection
- Tokenex PCI compliance benefits
- Transparent gateway routing flexibility
- 2.99% + \$0.30 pricing (vs Stripe's higher rates)

Processor Flexibility

This same checkout can route to:

- **Stripe** (via Digitzs MID) ✓ Current configuration
- **NMI** (via raw ProPay MID 33738480)
- **PayPal Payments Pro**
- Any processor integrated with Digitzs

Simply change the processor config in the edge function - no frontend changes needed.

Pricing

MyValet/Digitzs Pricing:

- \$29/month merchant account
- 2.99% + \$0.30 per transaction (all cards including AMEX)
- \$29 per chargeback notification
- \$29 per optional chargeback management
- \$58 per dispute escalation (auto-submission + best win rate)

Stripe Comparison:

- 2.9% + \$0.30 (Visa/MC)
- 3.5% + \$0.30 (AMEX)
- \$15 chargeback fee (no management)

Demo vs Production

Current Status: Demo mode

- Tokenex SDK loads but uses fallback mock processing
- Shows transaction flow without real charges
- Console logs full transaction details

To Enable Production:

1. Add Tokenex authentication key to `/src/services/payvia.ts`
2. Configure Digitzs API credentials in edge function
3. Set up webhook handlers for payment confirmations

4. Enable live transaction processing

Testing

Test the flow:

1. Click "Get Tickets" on homepage
2. Select a date (Thursday, Friday, or Saturday)
3. Choose a time slot (5PM - 9PM)
4. Fill in customer information
5. Enter test card: 4242 4242 4242 4242
6. Submit payment
7. View transaction details in console

Benefits of This Approach

✓ **PCI Compliant** - Tokenex handles all card data ✓ **Fraud Protection** - Device fingerprinting + IP tracking ✓ **Chargeback Defense** - Comprehensive data collection ✓ **Processor Agnostic** - Switch processors without code changes ✓ **TicketSocket Compatible** - Seamless integration ✓ **Better Rates** - 2.99% vs 3.5% for AMEX ✓ **Enhanced Security** - Triple-hash encryption at device level
