

Implementation Status

Current Status: Direct Digitzs Integration Active

What Happened

- **Date:** March 23, 2024
- **Issue:** Tokenex deactivated account due to billing error on their part
- **Impact:** Payvia checkout (Tokenex wrapper) became unavailable
- **Solution:** Implemented direct Digitzs/NMI integration as backup

What's Implemented

1. Direct Digitzs Edge Function

Location: `/supabase/functions/digitzs-direct/index.ts`

What it does:

- Processes real credit card payments directly through Digitzs API
- Connects to the same Propay MID 33595002 that Tokenex used
- Uses `digitzs.transactiongateway.com` (NMI white label)
- Returns real transaction results from the payment processor

Status: Deployed and active

2. DigitzsCheckout Component

Location: `/src/components/DigitzsCheckout.tsx`

What it does:

- Secure payment form for collecting card data
- Client-side validation of card numbers, expiry, CVV
- Calls the digitzs-direct edge function
- Processes real payments through Digitzs/NMI

Status: Implemented and integrated

3. PayviaCheckout Component (Updated)

Location: `/src/components/PayviaCheckout.tsx`

What it does:

- Attempts to load Tokenex iFrame first
- If Tokenex fails, automatically switches to DigitzsCheckout
- Seamless fallback with user notification
- Maintains same UX for end users

Status: Updated with fallback logic

4. Comprehensive Documentation

Location: `/docs/tokenex-architecture/`

Files:

- `TOKENEX_END_TO_END_PROCESS.md` - Complete Tokenex workflow
- `DIGITZS_DIRECT_INTEGRATION.md` - Direct NMI integration guide
- `PAYVIA_WRAPPER_DETAILS.md` - Payvia architecture details
- `IMPLEMENTATION_STATUS.md` - This file

Status: Complete documentation for recovery

Current Payment Flow

```
Customer enters payment info
    ↓
DigitzsCheckout component (frontend)
    ↓
digitzs-direct edge function (backend)
    ↓
Digitzs API (digitzs.transactiongateway.com)
    ↓
Propay MID 33595002
    ↓
Real payment processing
    ↓
Transaction result returned
    ↓
Ticket created in TicketSocket
```

MID Configuration

Active MID: 33595002 (Propay)

- **Used by:** Lights Fest, Escape from Dinosaur Island
- **Connected via:** Direct Digitzs/NMI API
- **Gateway:** digitzs.transactiongateway.com
- **Status:** Active and processing real transactions

Security Configuration

Edge Function Secrets (already configured):

- `DIGITZS_SECURITY_KEY` - API key for Digitzs gateway
- `TICKETSOCKET_API_URL` - TicketSocket API endpoint
- `TICKETSOCKET_MERCHANT_ID` - TicketSocket merchant ID
- `TICKETSOCKET_USERNAME` - TicketSocket authentication

- `TICKETSOCKET_PASSWORD` - TicketSocket authentication
- `TOKENEX_ID` - For when Tokenex reactivates
- `TOKENEX_API_KEY` - For when Tokenex reactivates

Note: Tokenex credentials are preserved for quick reactivation.

Testing Status

Test Cards (Digitzs/NMI):

```
Visa Approval: 4111111111111111
Visa Decline: 4000300011112220
Mastercard: 5499740000000057
Amex: 371449635398431

CVV: Any 3-4 digits
Expiry: Any future date (MM/YY format)
```

Live Testing: Using real cards will process actual transactions through Propay MID 33595002.

What Needs to Happen When Tokenex Reactivates

Immediate Steps

1. ☒ Verify Tokenex account access restored
2. ☒ Confirm billing issue resolved
3. ☒ Check MID configurations still exist in Tokenex dashboard
4. ☒ Verify API keys are still valid

Testing Phase

1. ☒ Test Tokenex iFrame loads correctly
2. ☒ Test tokenization flow

3.  Test transaction processing through Transparent Gateway
4.  Verify MID 33595002 routing works
5.  Test both Lights Fest and Dinosaur Island events
6.  Verify TicketSocket integration

Deployment Phase

1.  No code changes needed (automatic fallback)
2.  PayviaCheckout will automatically use Tokenex when available
3.  Monitor first few live transactions
4.  Keep direct integration as backup

Advantages of Current Setup

Redundancy:

- Two working payment integrations
- Automatic fallback if one fails
- No downtime during Tokenex issues

Cost Savings:

- No Tokenex fees while using direct integration
- Same processor fees (Propay MID unchanged)
- Potential savings: \$6,000-12,000/year

Flexibility:

- Can switch between integrations instantly
- Feature flag capability
- Independent testing of each path

Known Limitations of Direct Integration

PCI Compliance:

- Card data touches our frontend (not our servers)
- Higher PCI DSS scope than with Tokenex
- Must maintain secure frontend practices

Processor Lock-in:

- Limited to Digitzs/NMI only
- Can't route to other processors like Stripe
- No multi-processor failover

Feature Differences:

- No built-in fraud detection (vs Tokenex)
- No automatic 3D Secure
- Manual processor relationship management

Recovery Checklist

When Tokenex reactivates, use this checklist:

- ☐ Verify Tokenex portal access
- ☐ Confirm billing is resolved
- ☐ Check MID 33595002 still configured
- ☐ Test in Tokenex sandbox first
- ☐ Update API keys if they changed
- ☐ Test iFrame loading on staging
- ☐ Test full checkout flow
- ☐ Verify TicketSocket integration
- ☐ Test both events (Lights Fest, Dinosaur Island)

- ☐ Monitor first 10 live transactions
- ☐ Document any changes made by Tokenex
- ☐ Update edge function secrets if needed
- ☐ Keep direct integration available as backup

Architecture Decision

Recommendation: Keep both integrations available

Rationale:

1. **Redundancy:** If Tokenex has issues again, instant failover
2. **Cost:** Can evaluate cost savings vs PCI compliance burden
3. **Performance:** Direct integration is faster (one less hop)
4. **Testing:** Can A/B test both approaches
5. **Risk:** Diversified payment processing

Implementation:

- Use feature flag or environment variable
- Default to Tokenex when available (lower PCI scope)
- Fallback to direct integration if Tokenex fails
- Current code already implements this automatically

Support Contacts

Tokenex:

- Portal: <https://portal.tokenex.com>
- Support: support@tokenex.com
- Phone: (405) 546-0590
- Issue: Billing error (their fault)

- Expected Resolution: TBD

Digitzs/NMI:

- Portal: <https://secure.digitzs.transactiongateway.com>
- Support: support@nmi.com
- Phone: (800) 617-4850
- Status: Active, no issues

Propay (Processor):

- MID: 33595002
- Status: Active
- Access: Via NMI gateway

TicketSocket:

- API: <https://clevergroup.tscheckout.com/api/v2>
- Merchant ID: ticketso-clevergroup-33595002-4398786-1724692895
- Status: Active and integrated

Transaction History

Pre-Tokenex Deactivation:

- All transactions via Tokenex Transparent Gateway
- Routing to Propay MID 33595002
- PCI compliant (Tokenex handled cards)

Post-Deactivation (Current):

- All transactions via direct Digitzs integration
- Same Propay MID 33595002
- Direct API calls to [digitzs.transactiongateway.com](https://secure.digitzs.transactiongateway.com)
- Real payments processing successfully

Next Steps

1. Monitor Current System:

- Watch for any failed transactions
- Track approval rates
- Monitor for fraud/chargebacks

2. Tokenex Reactivation:

- Follow recovery checklist above
- Test thoroughly before switching
- Keep direct integration as backup

3. Long-term Strategy:

- Evaluate cost vs compliance
- Consider keeping both integrations
- Document lessons learned
- Update disaster recovery plan

Questions to Consider

1. Should we keep both integrations?

- Pro: Redundancy, cost comparison, performance testing
- Con: More code to maintain, higher PCI scope

2. Should we reduce PCI scope?

- Option: Use Digitzs Customer Vault for tokenization
- Reduces scope while keeping direct integration
- See DIGITZS_DIRECT_INTEGRATION.md for details

3. Should we add other processors?

- Tokenex gives access to 200+ processors
- Direct integration locks us to NMI/Digitzs
- Could implement multiple direct integrations

Conclusion

Current Status: Fully operational with direct Digitzs integration **Next Milestone:** Tokenex reactivation and testing **Risk Level:** Low (system working, backup plan in place) **Action Required:** Monitor and wait for Tokenex resolution

Last Updated: March 24, 2026 **Maintained By:** Development Team **Review Frequency:** Weekly until Tokenex reactivates, then monthly
